Abstract

This research paper investigates the intricate relationship between renewable energy policies and economic growth on a global scale. Against the backdrop of escalating environmental challenges and the urgent need to address climate change, nations worldwide are embracing renewable energy sources as integral components of their energy portfolios. The paper aims to unravel the complexities of this connection by examining the experiences of diverse countries and regions, shedding light on patterns, challenges, and success stories that characterize the impact of renewable energy policy interventions. Acknowledging the diverse arsenal of tools employed by governments, from incentives and subsidies to regulatory frameworks and technological innovation, our study takes a comprehensive approach to assess the effectiveness of these policies. The inherent complexities of the relationship are considered, taking into account political landscapes, technological advancements, and unique socio-economic contexts. Through a meticulous analysis of existing literature, empirical evidence, and case studies, this paper seeks to offer nuanced insights to inform policymakers, researchers, and stakeholders. The paper progresses
