## **CHAPTER 16**

### **The Structural Basis of the Gut–Brain Axis: Neuroanatomy of the Enteric Nervous System in Mental Health**

---

*Dr. Dewanshi Mishra, Associate Professor, Department of  
Anatomy*

*Dr. Abeer Zubair Khan, Professor & Head, Department of  
Anatomy*

*Dr. Hitesh Tiwari, Assistant Professor, Department of Pathology  
Integral Institute of Medical Sciences & Research (IIMSR),  
Integral University*

#### **I. Introduction: The Anatomical Basis of Gut–Brain Communication**

The relationship between the gastrointestinal system and the central nervous system represents a complex and highly integrated network often referred to as the gut–brain axis. This axis is not solely dependent on biochemical signaling but is fundamentally rooted in structural and neuroanatomical connections. The Enteric Nervous System (ENS), embedded within the wall of the gastrointestinal tract, constitutes a major component of this axis and plays a critical role in both physiological and psychological processes. [Figure-1]

The ENS contains approximately 200–600 million neurons, a number comparable to that of the spinal cord, and is capable of autonomous function. It regulates gastrointestinal motility, secretion, and blood flow, while simultaneously interacting with higher centers of the brain. These bidirectional interactions influence emotional regulation, stress responses, and cognitive function.

Understanding the structural organization of the ENS provides crucial insights into the pathophysiology of several mental health conditions. This chapter explores the embryological origins, histological organization, and functional integration of the ENS
